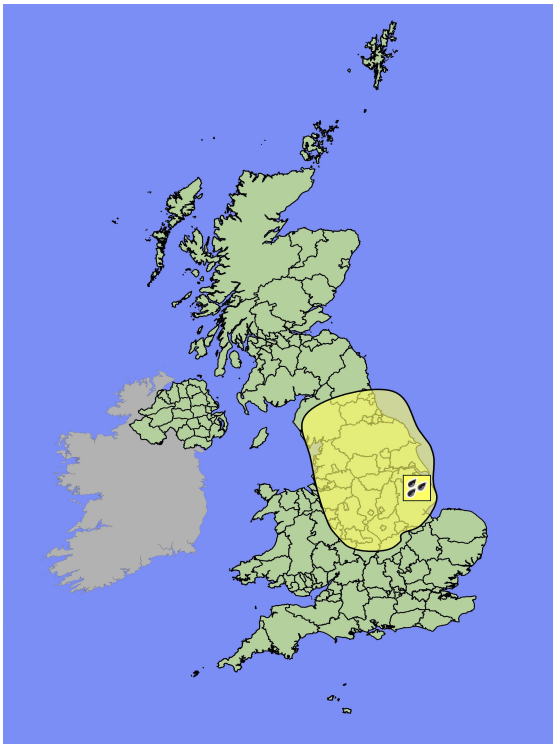
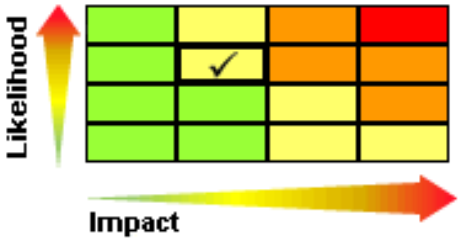
National Severe Weather Warning Service





Chief Forecasters Assessment
There remains a fair amount of uncertainty as to exact developments through today. However, the expectation is that an upper trough will cause de-stabilisation of the moist airmass lying across central and northern Britain, causing some heavy, potentially thundery, rainfall to break out. 20 to 30 mm is possible in places within a few hours, with a risk of isolated totals up to 40 mm. With the ground generally wet, some surface water issues seem likely to result.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **08:40 on Tue, 10th Jul 2012** until **20:00 on Tue, 10th Jul 2012**

Further heavy showers or longer spells of rain are likely across much of northern, central and eastern England today with scattered thunderstorms also likely.

The public should be aware that locally large amounts of rainfall may bring a risk of surface water flooding, as well as difficult driving conditions at times.

The Amber area over the northeast Midlands has been removed since latest information suggests that conditions will not be as severe as originally expected. However, there remains the likelihood of further surface water flooding.
